Departmental IA security policy
SCIS (ARNe) Acceptable Use Policy (adapted from SAN.org)

Departmental IA policy
SCIS (ARNe) Acceptable Encryption Policy
(adapted from SAN.org)

1.0 Purpose
The purpose of this policy is to provide guidance that limits the use of encryption to those algorithms that have received substantial public review and have been proven to work effectively. Additionally, this policy provides direction to ensure that Federal regulations are followed, and legal authority is granted for the dissemination and use of encryption technologies outside of the United States.

2.0 Scope
This policy applies to all ARNe students and affiliates.

3.0 Policy
Proven, standard algorithms such as DES, Blowfish, RSA, RC5 and IDEA should be used as the basis for encryption technologies. These algorithms represent the actual cipher used for an approved application. For example, Network Associate's Pretty Good Privacy (PGP) uses a combination of IDEA and RSA or Diffie-Hellman, while Secure Socket Layer (SSL) uses RSA encryption. Symmetric cryptosystem key lengths must be at least 56 bits. Asymmetric crypto-system keys must be of a length that yields equivalent strength. ARNe’s key length requirements will be reviewed annually and upgraded as technology allows.

The use of proprietary encryption algorithms is not allowed for any purpose, unless reviewed by qualified experts outside of the vendor in question and approved by ARNeSEC. Be aware that the export of encryption technologies is restricted by the U.S. Government. Residents of countries other than the United States should make themselves aware of the encryption technology laws of the country in which they reside.

4.0 Enforcement
Any student found to have violated this policy may be subject to disciplinary action, up to and including termination of employment.

5.0 Definitions
Term Definition
Proprietary Encryption An algorithm that has not been made public and/or has not withstood public scrutiny. The developer of the algorithm could be a vendor, an individual, or the government.

Symmetric Cryptosystem A method of encryption in which the same key is used for both encryption and decryption of the data.
Asymmetric Cryptosystem A method of encryption in which two different keys are used: one for encrypting and one for decrypting the data (e.g., public-key encryption).
